Assignment - I

Q1 Mistakes in the research paper related to Alternate Secure Wheel Model (ASWM) as per new software security guidelines

Ans Some common mistakes observed in the research paper related to ASWM

1. Lack of Integration with SDLC.
The model might not be properly integrated with all phases of the software development life cycle.
2. No continuous Monitoring.
New guidelines stress continuous security testing, monitoring, and feedback. If ASWM treats security as one-time task, it's flawed.
3. Overemphasis on Perimeter Security.
Modern threats require endpoint and internal network protection. ASWM may focus only on network perimeter defense.
4. Ignoring secure coding practices.

The phase might not stress secure coding standards (like OWASP), which are essential in current secure development guidelines.

5. Lack of Real-time Threat Response

6. Insufficient Documentation and Update Mechanism.

Q.2. Short note on (i) HTTP POST
(ii) GET parameters

(i) HTTP GET parameter

- Sent via URL e.g. example.com/page?name=john&age=25
- Visible in browser history and bookmarks
- Not secure for sensitive data (e.g. passwords)
- Used for retrieving data from the server.
- Limited data size due to URL length restrictions.

(ii) HTTP POST Parameters:

- Sent in the body of the HTTP request.

- not visible in the URL
- More secure than GET for sending sensitive data
- Suitable for large volumes of data.
- Used to submit or update data on the server (e.g. form submission)
- Cannot be bookmarked or cached.

~~Q3~~ ~~Wireless Access Points and~~
~~Vulnerabilities~~ ~~Practical Task~~

Mobi Armour

Mobi Armour is a comprehensive mobile application vulnerability assessment tool designed to test Android and iOS apps. It tests for a variety of security issues. It automates static and dynamic analysis to identify potential vulnerability misconfigurations and privacy violations in mobile apps.

Features and Functions

- Real-time Online Account Monitoring: Tracks online accounts for potential threats and suspicious activity.
- Leaked Password Detection :- Checks if your passwords have been compromised in data breaches.
- OTP Security :- Protects one-time passwords used in online transactions.
- QR code Analysis :- Scans QR codes.

for potential threats.

- Website Scanning: Scans websites for vulnerabilities and potential risks.
- App Audits: Scans installed apps for potential security risks.
- Wi-fi Security Checks: Checks the security of Wi-fi networks.
- Customized Security Recommendations: Provides personalized security advice based on your digital footprint.

Find true fact of fake news and
fact-finding news back from the Indian
Express, original photograph with
banner

Fake News and Fact-checking
in India

Fake news has become a significant
significant concern in India,
especially during election periods.
Indian express reports that during
the 10th Sabha elections, threads
such as traditional misinformation,
generation AI image, videos and
~~deepfakes~~ deepfakes have been prevalent.

Technological solution
To address the spread of fake
content, initiatives like the TruthToll
Hackathon have been launched,
encouraging the development of AI
tools capable of detecting fake
information in real-time across

various platform

Analyzing original Photographs
and Banners

1. Controversial Banner

A congress leader was suspended after a banner for Rahul Gandhi mistakenly featured Saverker instead of Mahatma Gandhi.
(The Indian Express)

2. Court Order:

Madras High Court banned using photos of living persons on banners/signboards in Tamil Nadu

3. Awareness Campaigns

⇒ Steps to Identify Fake news and Verify Facts

1) Check the sources

2) Cross-Reference Information

3) Analyze Image

4) Check official statements
